

## Maintenance for Washing Machines

The performance and appearance of your washing machine depends on a good cleaning regime. The units should be cleaned regularly.

**Chrome portions** of the washine machine should be washed regularly with hot soapy water to remove residues and deposits. Do not use scoring pads or harsh abrasive cleaners.

**White** portions of the washing machine can be wiped down using a damp soft cloth. Use of proprietary cleaners is acceptable however, harsh abrasive cleaners must be avoided. They can scratch the finish of the washing machine and will remove printed graphics prematurely.

The machine comes equipped with a **drum clean function**. This function should be used periodically to keep the drum clean and free of residues. Full details of this function are in the operating manual for the machine.

The **rubber door seal** should be checked periodically to ensure the seal is free of lint residues and any foreign objects.

**Filters** must be cleaned regularly. Instructions on how to drain the filter prior to removal are contained in the operating manual.
